## ⑤ Summary

# Loops?

## Loops

### Definite loops

Loop tricks I'd  
rather you  
avoid for now

### Indefinite loops

### Summary

- **loop:** a sequence of statements that is repeated
  - big time bug: *infinite loops*

# Why loops?

## Loops

### Definite loops

Loop tricks I'd  
rather you  
avoid for now

### Indefinite loops

### Summary

- like functions: avoid retyping code
  - many patterns repeated
  - same behavior, different data
- unlike functions: easily vary repetitions of code
  - easier than typing a function name 100 times
  - can repeat without knowing number of times when programming

# Types of loops

- definite
  - number of repetitions known at beginning of loop
- indefinite
  - number of repetitions not known (even unknowable) at beginning of loop

# Types of loops

- definite
  - number of repetitions known at beginning of loop
- indefinite
  - number of repetitions not known (even unknowable) at beginning of loop

*Python uses different constructions for each*

*∴ Sage uses different constructions for each*

# Outline

## ① Loops

## ② Definite loops

## ③ Loop tricks I'd rather you avoid for now

## ④ Indefinite loops

## ⑤ Summary

# The for command

for *each* in  $L$ :

*statement1*

*statement2*

...

where

- *each* is an identifier
- $L$  is an “iterable collection” (tuples, lists, sets)
- if you modify *each*,
  - corresponding element of  $L$  does *not* change
  - on next loop, *each* takes next element of  $L$  anyway

# What does it do?

**for** *each* in  $L$ :

*statement1*

*statement2*

...

- suppose  $L$  has  $n$  elements
- *statement1*, *statement2*, etc. are repeated (looped)  $n$  times
- on  $i$ th loop, *each* has the value of  $i$ th element of  $L$

# Trivial example

```
sage: for each in [1, 2, 3, 4]:  
       print each
```

1  
2  
3  
4

## Less trivial example

Loops

Definite loops

Loop tricks I'd  
rather you  
avoid for now

Indefinite loops

Summary

```
sage: for each in [x**2, cos(x), e**x*cos(x)]:  
       print diff(each)
```

$2*x$

$-\sin(x)$

$-e^x \sin(x) + e^x \cos(x)$

# What happened?

Loops

Definite loops

Loop tricks I'd  
rather you  
avoid for now

Indefinite loops

Summary

```
L == [x**2, cos(x), e**x*cos(x)]
```

# What happened?

## Loops

### Definite loops

Loop tricks I'd  
rather you  
avoid for now

### Indefinite loops

### Summary

```
L == [x**2, cos(x), e**x*cos(x)]
```

```
loop 1: each = x**2  
        print diff(each)  ~  2x
```

# What happened?

## Loops

### Definite loops

Loop tricks I'd  
rather you  
avoid for now

### Indefinite loops

### Summary

```
L == [x**2, cos(x), e**x*cos(x)]
```

```
loop 1: each = x**2  
        print diff(each)  ~> 2x
```

```
loop 2: each = cos(x)  
        print diff(each)  ~> -sin(x)
```

# What happened?

## Loops

### Definite loops

Loop tricks I'd  
rather you  
avoid for now

### Indefinite loops

### Summary

```
L == [x**2, cos(x), e**x*cos(x)]
```

```
loop 1: each = x**2  
        print diff(each)  ~> 2x
```

```
loop 2: each = cos(x)  
        print diff(each)  ~> -sin(x)
```

```
loop 3: each = e**x*cos(x)  
        print diff(each)  ~> -e^x*sin(x) + e^x*cos(x)
```

## Changing *each* ?

```
sage: L = [1,2,3,4]
sage: for each in L:
        each = each + 1
        print each
```

2

3

4

5

## Changing *each* ?

```
sage: L = [1,2,3,4]
sage: for each in L:
        each = each + 1
        print each
```

2

3

4

5

Notice: loop ran 4 times ( $L$  has 4 elements) even though *each* had value 5

# Changing $L$ ?

Loops

Definite loops

Loop tricks I'd  
rather you  
avoid for now

Indefinite loops

Summary

**Don't modify  $L$  unless you know what you're doing.**

## Changing $L$ ?

Don't modify  $L$  **unless** you know what you're doing.  
Usually, you don't.

```
sage: L = [1,2,3,4]
```

```
sage: for each in L:  
      L.append(each+1)
```

## Changing $L$ ?

Don't modify  $L$  **unless** you know what you're doing.  
Usually, you don't.

```
sage: L = [1,2,3,4]
```

```
sage: for each in L:  
      L.append(each+1)
```

...infinite loop!

## More detailed example

Given  $f(x)$ ,  $a, b \in \mathbb{R}$ , and  $n \in \mathbb{N}$ , estimate  $\int_a^b f(x) dx$  using  $n$  left Riemann sums.

## More detailed example

Given  $f(x)$ ,  $a, b \in \mathbb{R}$ , and  $n \in \mathbb{N}$ , estimate  $\int_a^b f(x) dx$  using  $n$  left Riemann sums.

- Excellent candidate for definite loop if  $n$  known from outset.
  - Riemann sum: *repeated* addition: loop!
  - If  $n$  is *not* known, can still work, but a function with a loop is better. (Details later.)
- Start with pseudocode...

# Pseudocode for definite loop

Loops

Definite loops

Loop tricks I'd  
rather you  
avoid for now

Indefinite loops

Summary

```
for counter  $\in L$   
    loop statement 1  
    loop statement 2  
    ...  
out-of-loop statement 1
```

# Pseudocode for definite loop

Loops

Definite loops

Loop tricks I'd  
rather you  
avoid for now

Indefinite loops

Summary

```
for counter  $\in$  L  
    loop statement 1  
    loop statement 2  
    ...  
out-of-loop statement 1
```

Notice:

- indentation ends at end of loop
- $\in$ , not `in` (mathematics, not Python)
- no colon

# Building pseudocode

Ask yourself:

- What list do I use to repeat the action(s)?
- What do I have to do in each loop?
  - How do I break the task into pieces?
  - ***Divide et impera! Divide and conquer!***

## How do we estimate limits using left Riemann sums?

Loops

Definite loops

Loop tricks I'd  
rather you  
avoid for now

Indefinite loops

Summary

How do we estimate limits using left Riemann sums?

$$\int_a^b f(x) dx \approx \sum_{i=1}^n f(x_i) \Delta x$$

where

- $\Delta x = \frac{b-a}{n}$
- $x_1 = a, x_2 = a + \Delta x, x_3 = a + 2\Delta x, \dots, x_n = a + (n-1)\Delta x$ 
  - short:  $x_i = a + (i-1)\Delta x$

How do we estimate limits using left Riemann sums?

$$\int_a^b f(x) dx \approx \sum_{i=1}^n f(x_i) \Delta x$$

where

- $\Delta x = \frac{b-a}{n}$
- $x_1 = a, x_2 = a + \Delta x, x_3 = a + 2\Delta x, \dots, x_n = a + (n-1)\Delta x$ 
  - short:  $x_i = a + (i-1)\Delta x$

So...

- $L = [1, 2, \dots, n]$
- repeat addition of  $f(x_i) \Delta x$ 
  - use computer to remember previous value and add to it
  - $sum = sum + \dots$

## Pseudocode

Let  $\Delta x = \frac{b-a}{n}$

Let  $L = [1, 2, \dots, n]$

Let  $S = 0$

**for**  $i \in L$

$$x_i = a + (i - 1) \Delta x$$

$$S = S + f(x_i) \Delta x$$

this is not given

set up  $L$ —notice no Pythonese

$S$  must start at 0 (no sum)

determine  $x_i$

add to  $S$

## Pseudocode

Let  $\Delta x = \frac{b-a}{n}$

Let  $L = [1, 2, \dots, n]$

Let  $S = 0$

for  $i \in L$

$x_i = a + (i - 1)\Delta x$

$S = S + f(x_i)\Delta x$

this is not given

set up  $L$ —notice no Pythonese

$S$  must start at 0 (no sum)

determine  $x_i$

add to  $S$

translates to Sage as...

```
Delta_x = (b - a)/x
```

```
L = range(1,n+1)
```

```
S = 0
```

```
for i in L:
```

```
    xi = a + (i - 1)*Delta_x
```

```
    S = S + f(x=xi)*Delta_x
```

*now* use Pythonese

Try it!

Loops

Definite loops

Loop tricks I'd  
rather you  
avoid for now

Indefinite loops

Summary

```
sage: f = x**2; a = 0; b = 1; n = 3
sage: Delta_x = (b - a)/n
sage: L = range(1,n+1)
sage: S = 0
sage: for i in L:
        xi = a + (i - 1)*Delta_x
        S = S + f(x=xi)*Delta_x
sage: S
```

Try it!

Loops

Loop tricks I'd  
rather you  
avoid for now

Indefinite loops

Summary

```
sage: f = x**2; a = 0; b = 1; n = 3
sage: Delta_x = (b - a)/n
sage: L = range(1,n+1)
sage: S = 0
sage: for i in L:
        xi = a + (i - 1)*Delta_x
        S = S + f(x=xi)*Delta_x
sage: S
5/27
```

# What happened?

$L = [1, 2, 3]$

# What happened?

```
L = [1,2,3]
```

```
loop 1:  $i = 1$ 
```

```
xi = a + (i - 1)*Delta_x
```

$\rightsquigarrow$   $xi = 0 + 0*(1/3) = 0$

```
S = S + f(x=xi)*Delta_x
```

$\rightsquigarrow$   $S = 0 + f(0)*(1/3) = 0$

Loops

Definite loops

Loop tricks I'd  
rather you  
avoid for now

Indefinite loops

Summary

## What happened?

$L = [1, 2, 3]$

loop 1:  $i = 1$

$xi = a + (i - 1) * Delta\_x$

$$\rightsquigarrow xi = 0 + 0 * (1/3) = 0$$

$S = S + f(x=xi) * Delta\_x$

$$\rightsquigarrow S = 0 + f(0) * (1/3) = 0$$

loop 2:  $i = 2$

$xi = a + (i - 1) * Delta\_x$

$$\rightsquigarrow xi = 0 + 1 * (1/3) = 1/3$$

$S = S + f(x=xi) * Delta\_x$

$$\rightsquigarrow S = 0 + f(1/3) * (1/3) = 1/27$$

Loops

Definite loops

Loop tricks I'd  
rather you  
avoid for now

Indefinite loops

Summary

## What happened?

$L = [1, 2, 3]$

loop 1:  $i = 1$

$xi = a + (i - 1) * Delta\_x$

$$\rightsquigarrow xi = 0 + 0 * (1/3) = 0$$

$S = S + f(x=xi) * Delta\_x$

$$\rightsquigarrow S = 0 + f(0) * (1/3) = 0$$

loop 2:  $i = 2$

$xi = a + (i - 1) * Delta\_x$

$$\rightsquigarrow xi = 0 + 1 * (1/3) = 1/3$$

$S = S + f(x=xi) * Delta\_x$

$$\rightsquigarrow S = 0 + f(1/3) * (1/3) = 1/27$$

loop 3:  $i = 3$

$xi = a + (i - 1) * Delta\_x$

$$\rightsquigarrow xi = 0 + 2 * (1/3) = 2/3$$

$S = S + f(x=xi) * Delta\_x$

$$\rightsquigarrow S = 1/27 + f(2/3) * (1/3) = 5/27$$

Try it with larger  $n$ !

Loops

Definite loops

Loop tricks I'd  
rather you  
avoid for now

Indefinite loops

Summary

```
sage: f = x**2; a = 0; b = 1; n = 1000
sage: Delta_x = (b - a)/n
sage: L = range(1,n+1)
sage: S = 0
sage: for i in L:
        xi = a + (i - 1)*Delta_x
        S = S + f(x=xi)*Delta_x
sage: S
```

## Try it with larger $n$ !

Loops

Definite loops

**return**  $S$

don't forget to report the result!

# Translate into Sage code...

Loops

Definite loops

Loop tricks I'd  
rather you  
avoid for now

Indefinite loops

Summary

...on your own. Raise your hand if you need help.

You should be able to compute:

- `left_Riemann_sum(x**2, 0, 1, 3)`
- `left_Riemann_sum(x**2, 0, 1, 1000)`

...and obtain the same answers as before.

Loops

Definite loops

Loop tricks I'd  
rather you  
avoid for now

Indefinite loops

Summary

## ① Loops

## ② Definite loops

## ③ Loop tricks I'd rather you avoid for now

## ④ Indefinite loops

## ⑤ Summary

# Looping through nonexistent lists

Loops

Definite loops

Loop tricks I'd  
rather you  
avoid for now

Indefinite loops

Summary

- for *each* in  $L$ 
  - $L$  an “iterable collection”
- may not want to construct list of  $n$  elements; merely repeat  $n$  times
  - for *each* in `xrange( $L$ )` has same effect
  - slightly faster, uses less computer memory

# Building lists from lists

Python (Sage) has a handy list constructor

- Suppose  $L_{\text{old}}$  has  $n$  elements
- Let  $L_{\text{new}} = [f(x) \text{ for } x \in L_{\text{old}}]$ 
  - $L_{\text{new}}$  will be a list with  $n$  elements
  - $L_{\text{new}}[i] == f(L_{\text{old}}[i])$

# Example

Loops

Definite loops

Loop tricks I'd  
rather you  
avoid for now

Indefinite loops

Summary

```
sage: L = [x**2 for x in range(10)]
sage: L
[0, 1, 4, 9, 16, 25, 36, 49, 64, 81]
```

# Outline

## ① Loops

## ② Definite loops

## ③ Loop tricks I'd rather you avoid for now

## ④ Indefinite loops

## ⑤ Summary

# The while command

```
while(condition):  
  statement1  
  statement2  
  ...
```

where

- statements are executed while *condition* remains true
- like definite loops, variables in *condition* can be modified
- **warning:** statements will *not* be executed if *condition* is false from the get-go

# Pseudocode for indefinite loop

Loops

Definite loops

Loop tricks I'd  
rather you  
avoid for now

Indefinite loops

Summary

**while** *condition*

*statement1*

*statement2*

...

*out-of-loop statement 1*

# Pseudocode for indefinite loop

Loops

Definite loops

Loop tricks I'd  
rather you  
avoid for now

Indefinite loops

Summary

**while** *condition*

*statement1*

*statement2*

...

*out-of-loop statement 1*

Notice:

- indentation ends at end of loop
- *condition* is not in parentheses (plain English, not Python)
- no colon

## Silly example

```
sage: f = x**10
sage: while (f != 0):
        f = diff(f)
        print f
```

$90x^8$

$720x^7$

$5040x^6$

$30240x^5$

$151200x^4$

$604800x^3$

$1814400x^2$

$3628800x$

$3628800$

$0$

## More interesting example

Use the Method of Bisection to approximate a root of  $\cos x - x$  on the interval  $[0, 1]$ , correct to the hundredths place.

## More interesting example

Use the Method of Bisection to approximate a root of  $\cos x - x$  on the interval  $[0, 1]$ , correct to the hundredths place.

*Hunh?!?*

# Method of Bisection?

The Method of Bisection is based on:

## Theorem (Intermediate Value Theorem)

*If*

- *$f$  is a continuous function on  $[a, b]$ , and*
- *$f(a) \neq f(b)$ ,*

*then*

- *for any  $C$  between  $f(a)$  and  $f(b)$ ,*
- *$\exists c \in (a, b)$  such that  $f(c) = C$ .*

Loops

Definite loops

Loop tricks I'd  
rather you  
avoid for now

Indefinite loops

Summary

# Method of Bisection?

The Method of Bisection is based on:

## Theorem (Intermediate Value Theorem)

*If*

- *$f$  is a continuous function on  $[a, b]$ , and*
- *$f(a) \neq f(b)$ ,*

*then*

- *for any  $C$  between  $f(a)$  and  $f(b)$ ,*
- *$\exists c \in (a, b)$  such that  $f(c) = C$ .*

**Upshot:** To find a root— $f(c) = 0$ —of a continuous function  $f$ , start with two  $x$  values  $a$  and  $b$  such that  $f(a)$  and  $f(b)$  have different signs, then bisect the interval.

## Back to the example...

Given

- $f(x) = \cos x - x$ 
  - continuous because it is a difference of continuous functions
- $a = 0$  and  $b = 1$ 
  - $f(a) = 1 > 0$
  - $f(b) \approx -0.4597 < 0$

Intermediate Value Theorem applies: can start Method of Bisection.

## How to solve it?

*Idea:* Interval endpoints  $a$  and  $b$  are not close enough as long as their digits differ through the hundredths place.

# How to solve it?

***Idea:*** Interval endpoints  $a$  and  $b$  are not close enough as long as their digits differ through the hundredths place.

***Application:*** While their digits differ through the hundredths place, halve the interval.

## How to solve it?

***Idea:*** Interval endpoints  $a$  and  $b$  are not close enough as long as their digits differ through the hundredths place.

***Application:*** While their digits differ through the hundredths place, halve the interval.

***“Halve” the interval?*** Pick the half containing a root!

Loops

Definite loops

Loop tricks I'd  
rather you  
avoid for now

Indefinite loops

Summary

## ① Loops

## ② Definite loops

## ③ Loop tricks I'd rather you avoid for now

## ④ Indefinite loops

## ⑤ Summary

- Two types of loops
  - definite:  $n$  repetitions known at outset
    - **for**  $i \in L$
    - list  $L$  of  $n$  elements controls loop
    - don't modify  $L$
  - indefinite: number of repetitions not known at outset
    - **while** *condition*
    - Boolean *condition* controls loop
