

MAT 305: Mathematical Computing

Lecture 9: 3d plots in Sage

John Perry

University of Southern Mississippi

Fall 2009

3d objects

3d plots of
functions

Summary

Outline

① 3d objects

② 3d plots of functions

③ Summary

You should be in worksheet mode to repeat the examples.

Outline

3d objects

3d plots of
functions

Summary

① 3d objects

② 3d plots of functions

③ Summary

The point3d() command

3d objects

3d plots of
functions

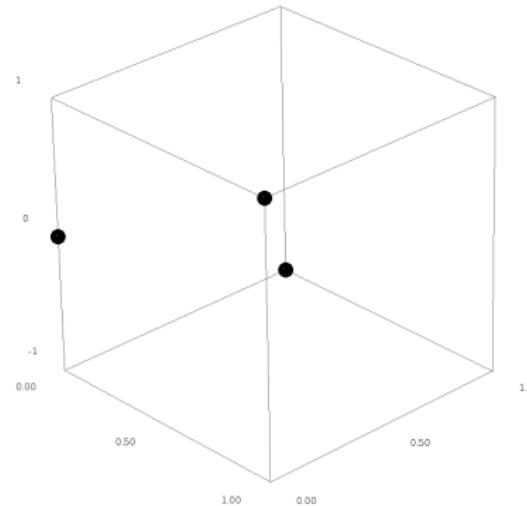

Summary

`point3d((x,y,z), options)` where

- (x,y,z) is a 3-tuple (the location in \mathbb{R}^3 of this point)
 - can send list of points $[(x_1,y_1,z_1), (x_2,y_2,z_2), \dots]$
- *options* include
 - `rgbcolor`
 - `size` (*not pointsize*; default is 5)
 - `opacity` (more on this later)

Example

```
sage: point3d([(0,0,0),(0,1,-1),(1,0,1)],  
            rgbcolor=(0,0,0), size=20)
```

notice that the pointer can grab the image and rotate it for a better view!

The line3d() command

3d objects

3d plots of
functions

Summary

`line3d([(x1,y1,z1),(x2,y2,z2),...], options)` where

- $[(x_1,y_1,z_1),(x_2,y_2,z_2),\dots]$ is a list of *at least two* points
 - more than two points? consecutive lines
- *options* include
 - `rgbcolor`
 - `thickness`
 - `arrow_head=True` for arrow on final point
 - `opacity` (more on this later)

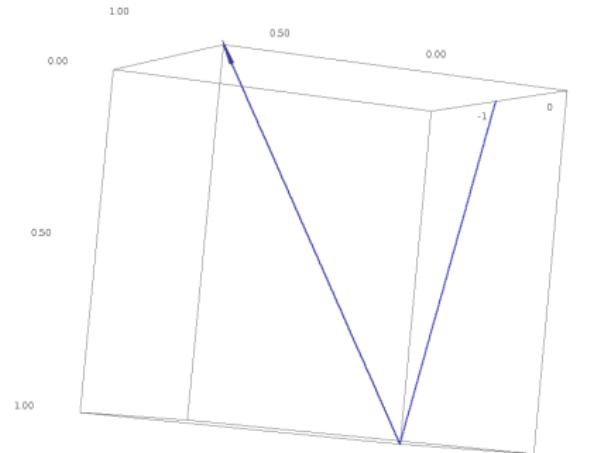

Example

3d objects

3d plots of
functions

Summary

```
sage: line3d([(0,0,0),(0,1,-1),(1,0,1)],  
           thickness=2, arrow_head=True)
```

The polygon3d() command

3d objects

3d plots of
functions

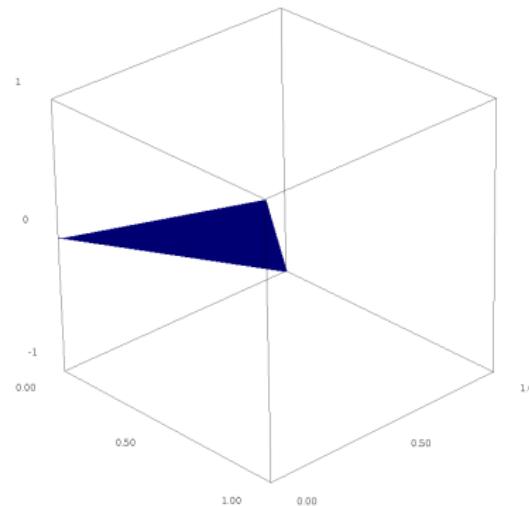

Summary

`polygon3d([(x_1, y_1, z_1), (x_2, y_2, z_2), ...], options) where`

- $[(x_1, y_1, z_1), (x_2, y_2, z_2), \dots]$ is a list of *at least two points*
 - fewer than 2? nothing drawn
- *options* include
 - `rgbcolor`
 - `opacity` (more on this later)

Example

```
sage: polygon3d([(0,0,0),(0,1,-1),(1,0,1)])
```

Opacity

3d objects

3d plots of
functions

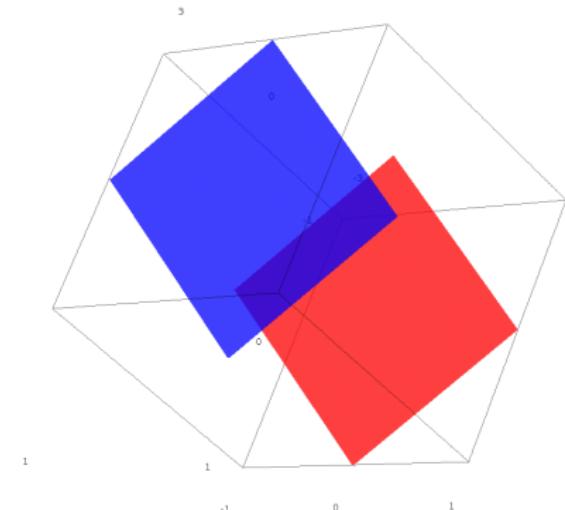

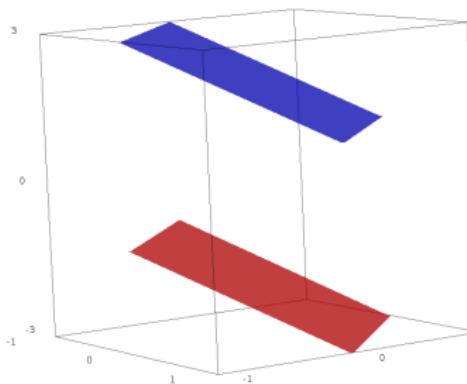

Summary

controls whether you can “see through” the object

- ranges from 0 to 1
- 0: completely translucent (invisible)
- 1: completely opaque
- useful when combining many objects

Example: two parallel planes

```
sage: p1 = polygon3d([(1,0,1),(0,1,1),(-1,0,3),(0,-1,3)],  
                      opacity=0.75)  
sage: p2 = polygon3d([(1,0,-3),(0,1,-3),(-1,0,-1),(0,-1,-1)],  
                      rgbcolor=(1,0,0), opacity=0.75)  
sage: p1 + p2
```

Outline

3d objects

3d plots of
functions

Summary

① 3d objects

② 3d plots of functions

③ Summary

Variables

3d objects

3d plots of
functions

Summary

- “standard” 2d: y depends on x
 - can define otherwise if necessary
 - Q as functions of t
- “standard” 3d: z depends on x, y
 - can define otherwise
 - x given (unless changed); must define at least y

3d objects

3d plots of
functions

Summary

The plot3d() command

`plot3d($f(x,y)$, $(x, \text{xmin}, \text{xmax})$, $(y, \text{ymin}, \text{ymax})$,
 $options$)`

where

- $f(x,y)$ is a function of x and y
- $options$ include
 - `adaptive=True` for a better-looking graph (but slower)
 - `mesh=True` for mesh grid lines
 - `dots=True` to show dots at grid points
 - `color`
 - `opacity`

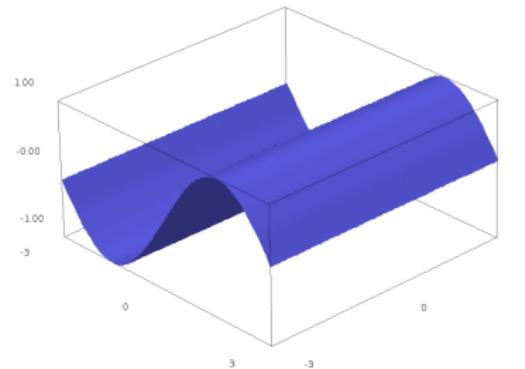

Example 1

3d objects

3d plots of
functions

Summary

```
sage: plot3d(sin(x), (x,-3,3), (y,-3,3))
```

notice that the pointer can grab the image and rotate it for a better view!

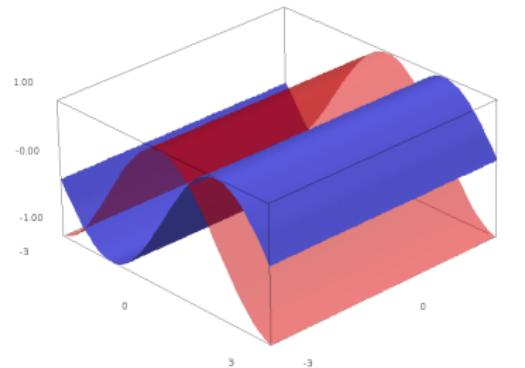

Example 2: color and opacity

3d objects

3d plots of
functions

Summary

```
sage: p1 = plot3d(sin(x), (x,-3,3), (y,-3,3))  
sage: p2 = plot3d(cos(x), (x,-3,3), (y,-3,3),  
                   bgcolor=(1,0,0), opacity=0.5)  
sage: p1+p2
```

Let's do something marginally useful

Plot $z = \sin x \cos y$ and the tangent plane at $(x, y, z) = \left(\frac{\pi}{6}, \frac{\pi}{3}, \frac{1}{4}\right)$.

(Tangent plane is $z = f_x(x_0, y_0) \cdot (x - x_0) + f_y(x_0, y_0) \cdot (y - y_0) + z_0$).
Make the plane red and translucent.

Let's do something marginally useful

Plot $z = \sin x \cos y$ and the tangent plane at $(x, y, z) = \left(\frac{\pi}{6}, \frac{\pi}{3}, \frac{1}{4}\right)$.

(Tangent plane is $z = f_x(x_0, y_0) \cdot (x - x_0) + f_y(x_0, y_0) \cdot (y - y_0) + z_0$.)

Make the plane red and translucent.

```
sage: f = sin(x)*cos(y)
sage: p1 = plot3d(f, (x,-pi/4,3*pi/4), (y,-pi/4,3*pi/4))
sage: dfx = diff(f,x) (Need partial derivatives)
sage: dfy = diff(f,y)
sage: a=pi/6; b = pi/3
sage: tanplane = dfx(x=a,y=b)*(x-a) + dfy(x=a,y=b)*(y-b)
           + f(x=a,y=b)
sage: p2 = plot3d(tanplane, (x,pi/4,3*pi/4), (y,-pi/4,pi/4),
                  bgcolor=(1,0,0), opacity=0.75)
sage: p3 = point3d((a,b,f(x=a,y=b)),bgcolor=(0,0,0),size=10)
sage: p1+p2+p3
```

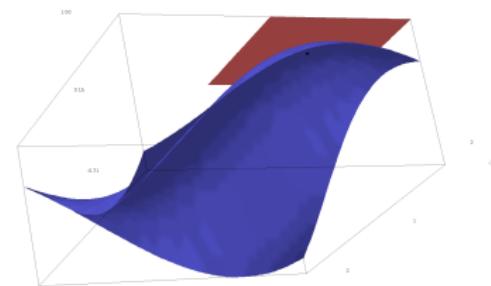

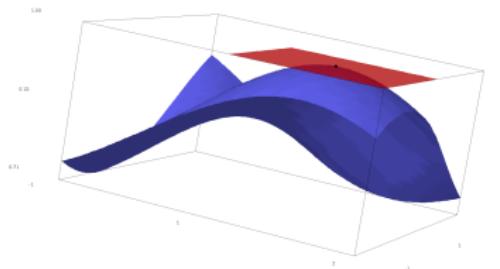

...and you get...

The graduating seagull!

3d objects

3d plots of
functions

Summary

Let's add a normal vector

3d objects

3d plots of
functions

Summary

```
sage: fgrad = (f - z).gradient()  
                                (Think about why I had to do this)  
  
sage: fgrad  
(cos(x)*cos(y), -sin(x)*sin(y), -1)  
  
sage: dx, dy, dz = fgrad(x=a,y=b)  
  
sage: c = f(x=a,y=b)  
  
sage: nvec = line3d([(a,b,c),(a+dx,b+dy,c+dz)],  
                      bgcolor=(0,0,0),thickness=2,  
                      arrow_head=True)  
  
sage: p1 + p2 + p3 + nvec
```

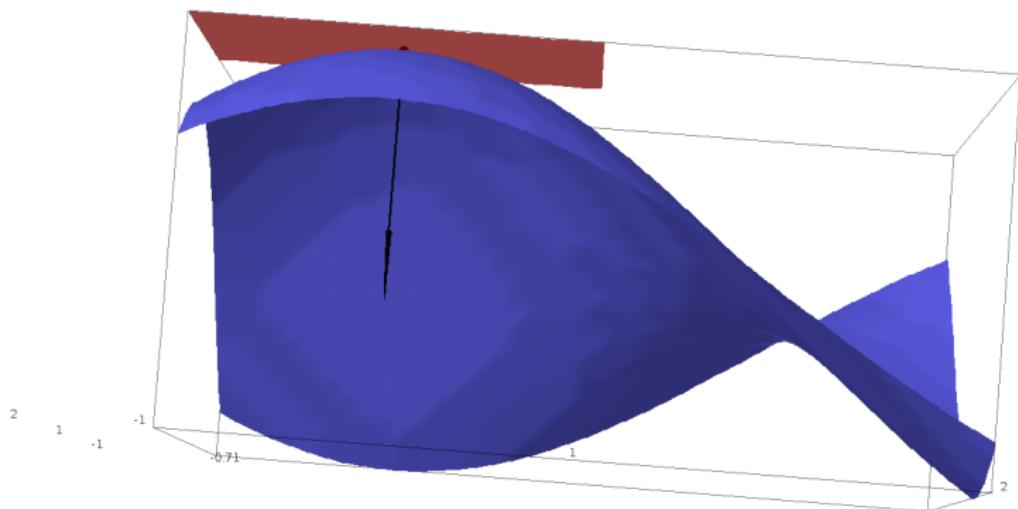

... and you get...

Result

3d objects

3d plots of
functions

Summary

② 3d plots of functions

③ Summary

Summary

3d objects

3d plots of
functions

Summary

- Sage offers many ways to plot 3d objects and functions
 - plots can be rotated
 - images can be saved
- adjusting opacity allows one to see through an object
