Loops?

Why loops?

▲□▶▲□▶▲□▶▲□▶ □ のQ@

Loops

Definite loops Some useful tricks w/loops

MAT 305: Mathematical

Computing John Perry

Summary

- like functions: avoid retyping code
 - many patterns repeated
 - same behavior, different data
- don't know number of repetitions when programming

Types of loops

◆□▶ ◆□▶ ◆□▶ ◆□▶ □ - つへつ

Loops

Definite loops

MAT 305: Mathematical

Computing John Perry

- Some useful tricks w/loops Indefinite loops
- definite
 - number of repetitions known at beginning of loop
 - indefinite
 - number of repetitions not known at beginning of loop
 - number of repetitions unknownable at beginning of loop

Types of loops

◆□▶ ◆□▶ ◆□▶ ◆□▶ □ - つへつ

Loops

Definite loops

MAT 305: Mathematical

Computing John Perry

tricks w/loops

Summary

• definite

- number of repetitions known at beginning of loop
- indefinite
 - number of repetitions not known at beginning of loop
 - number of repetitions unknownable at beginning of loop

Most languages use different constructions for each

Given f(x), $a, b \in \mathbb{R}$, and $n \in \mathbb{N}$, estimate $\int_{a}^{b} f(x) dx$ using *n* left Riemann sums.

John Perry

Loops

Definite loops

Some useful tricks w/loops Indefinite loops Summary

More detailed example

< ロ > < 同 > < 三 > < 三 > < 三 > < ○ < ○ </p>

Given f(x), $a, b \in \mathbb{R}$, and $n \in \mathbb{N}$, estimate $\int_{a}^{b} f(x) dx$ using *n* left Riemann sums.

- Excellent candidate for definite loop if *n* known from outset.
 - Riemann sum: *repeated* addition: loop!
 - If *n* is not known, can still work... details later
- Start with pseudocode...

John Perry

Loops

Definite loops

Some useful tricks w/loops Indefinite loops Summary

How do we estimate limits using left Riemann sums?

$$\int_{a}^{b} f(x) \, dx \approx \sum_{i=1}^{n} f(x_i) \, \Delta x$$

Review

▲□▶▲□▶▲□▶▲□▶ □ のQ@

where

• $\Delta x = \frac{b-a}{n}$ • $x_1 = a, x_2 = a + \Delta x, x_3 = a + 2\Delta x, \dots x_n = a + (n-1)\Delta x$ • short: $x_i = a + (i-1)\Delta x$

John Perry

Loops

Definite loops

Some useful tricks w/loops Indefinite loops Summary

How do we estimate limits using left Riemann sums?

$$\int_{a}^{b} f(x) \, dx \approx \sum_{i=1}^{n} f(x_i) \, \Delta x$$

where

Δx = ^{b-a}/_n
 x₁ = a, x₂ = a + Δx, x₃ = a + 2Δx, ... x_n = a + (n - 1)Δx
 short: x_i = a + (i - 1)Δx

So. . .

- $C = (1, 2, \ldots, n)$
- repeat addition of $f(x_i)\Delta x$
 - use computer to remember previous value and add to it
 - $sum = sum + \dots$

Review

John Perry

Loops Definite loops Some useful tricks w/loops Indefinite loop Let $\Delta x = \frac{b-a}{n}$ Let C = (1, 2, ..., n)Let S = 0for $i \in C$ $x_i = a + (i-1)\Delta x$ $S = S + f(x_i)\Delta x$

Pseudocode

this is not given set up *L*—notice no Pythonese *S* must start at 0 (no sum)

> determine x_i add to S

John Perry

Definite loops Some useful tricks w/loops Indefinite loops Summery

```
Let \Delta x = \frac{b-a}{n}

Let C = (1, 2, ..., n)

Let S = 0

for i \in C

x_i = a + (i-1)\Delta x

S = S + f(x_i)\Delta x
```

Pseudocode

this is not given set up *L*—notice no Pythonese *S* must start at 0 (no sum)

> determine x_i add to S

translates to Sage as... Delta_x = (b - a)/n C = range(1,n+1) S = 0 for i in C: xi = a + (i - 1)*Delta_x S = S + f(x=xi)*Delta_x

now use Pythonese

5 Summary

Outline

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ ─臣 ─のへ(?)

John Perry

Loops

Definite loops

Some useful tricks w/loops Indefinite loops Summary

Looping through nonexistent lists

- range (n) creates a list of n elements
 - for each in range (n) creates the list before looping

◆□▶ ◆□▶ ◆□▶ ◆□▶ □ - つへつ

- constructing a list, merely to repeat *n* times, is wasteful
 - for each in xrange(n) has same effect
 - slightly faster, uses less computer memory

John Perry

Loops

Definite loops

Some useful tricks w/loops Indefinite loops

Building lists from lists

▲□▶▲□▶▲□▶▲□▶ □ のQ@

Python (Sage) has a handy list constructor

- Suppose C_{old} has *n* elements
- Let $C_{\text{new}} = [f(x) \text{ for } x \in C_{\text{old}}]$
 - C_{new} will be a list with *n* elements
 - $C_{\text{new}}[i] == f(C_{\text{old}}[i])$

$algorithm\ method_of_bisection$

inputs

f, a continuous function

 $a, b \in \mathbb{R}$ such that $a \neq b$ and f(a) and f(b) have different signs

outputs

 $c \in [a, b]$ such that $f(c) \approx 0$ and c accurate to hundredths place

Pseudocode

algorithm method of bisection

inputs

f, a continuous function

 $a, b \in \mathbb{R}$ such that $a \neq b$ and f(a) and f(b) have different signs

outputs

 $c \in [a, b]$ such that $f(c) \approx 0$ and c accurate to hundredths place do

while the digits of *a* and *b* differ through the hundredths Let $c = \frac{a+b}{2}$ if f(a) and f(c) have the same sign Interval now $\left(\frac{a+b}{2}, b\right)$ Let a = celse if f(a) and f(c) have opposite signs Interval now $\left(a, \frac{a+b}{2}\right)$ Let b = cwe must have f(c) = 0

else

return c return a, rounded to hundredths place

Loops

- Definite loops
- Some useful tricks w/loops
- Indefinite loops
- Summary

Summary

▲□▶▲□▶▲□▶▲□▶ □ のQ@

Two types of loops

- definite: *n* repetitions known at outset
 - for $c \in C$
 - collection C of n elements controls loop
 - don't modify *C*
- indefinite: number of repetitions not known at outset
 - while condition
 - Boolean condition controls loop
