Loops

Indefinite loops Summary

MAT 305: Mathematical Computing

John Perry

• loop: a sequence of statements that is repeated

big time bug: infinite loops

Loops?

Loops

Indefinite loops Summary

MAT 305: Mathematical

Computing John Perry

• loop: a sequence of statements that is repeated

big time bug: infinite loops

"infinite loop"? see infinite loop

- AmigaDOS manual, ca. 1993

Why loops?

◆□▶ ◆□▶ ◆□▶ ◆□▶ □ - つへつ

Loops

Indefinite loops Summary

MAT 305: Mathematical

Computing John Perry

- like functions: avoid retyping code
 - many patterns repeated
 - same behavior, different data
- don't know number of repetitions when programming

Types of loops

◆□▶ ◆□▶ ◆□▶ ◆□▶ □ - つへつ

Loops

Indefinite loops Summary

MAT 305: Mathematical

Computing John Perry

- definite
 - number of repetitions known at beginning of loop
- indefinite
 - number of repetitions not known at beginning of loop
 - number of repetitions unknownable at beginning of loop

Types of loops

◆□▶ ◆□▶ ◆□▶ ◆□▶ □ - つへつ

Loops

Indefinite loops Summary

MAT 305: Mathematical

Computing John Perry

- definite
 - number of repetitions known at beginning of loop
- indefinite
 - number of repetitions not known at beginning of loop
 - number of repetitions unknownable at beginning of loop

Most languages use different constructions for each

John Perry

Loops Indefinite loops

1 Loops

2 Indefinite loops

3 Summary

Outline

John Perry

Loops Indefinite loops Summary

The while command

while condition : statement1 statement2 ...

where

- statements are executed while condition remains true
 - statements will *not* be executed if *condition* is false from the get-go
- like definite loops, variables in condition can be modified
- unlike definite loops, variables in *condition* **should** be modified

John Perry

Loops Indefinite loops Pseudocode for indefinite loop

while condition statement1 statement2 ... out-of-loop statement 1

John Perry

Loops Indefinite loops Pseudocode for indefinite loop

▲□▶▲□▶▲□▶▲□▶ □ のQ@

while condition statement1 statement2 ... out-of-loop statement 1

Notice:

- indentation ends at end of loop
- no colon

John Perry

Loops Indefinite loops Summary

sage: f = x * * 10sage: while f != 0: f = diff(f)print f 10*x^9 90*x^8 720*x^7 5040*x^6 30240*x^5 151200*x^4 604800*x^3 1814400*x^2 3628800*x 3628800 0

Example

John Perry

Loops Indefinite loops

More interesting example

▲□▶▲□▶▲□▶▲□▶ □ のQ@

Use the Method of Bisection to approximate a root of $\cos x - x$ on the interval [0, 1], correct to the hundredths place.

John Perry

Loops Indefinite loops

More interesting example

▲□▶▲□▶▲□▶▲□▶ □ のQ@

Use the Method of Bisection to approximate a root of $\cos x - x$ on the interval [0, 1], correct to the hundredths place.

Hunh?!?

John Perry

Loops Indefinite loops

The Method of Bisection is based on: Theorem (Intermediate Value Theorem) *If*

- f is a continuous function on [a,b], and
- $f(a) \neq f(b)$,

then

- for any y between f(a) and f(b),
- $\exists c \in (a, b)$ such that f(c) = y.

Method of Bisection?

▲□▶▲□▶▲□▶▲□▶ □ のQ@

Continuous?

▲□▶▲□▶▲□▶▲□▶ □ のQ@

Mathematical Computing John Perry

MAT 305-

Loops Indefinite loops

- f continuous at x = a if
 - can evaluate limit at x = a by computing f(a), or
 - can draw graph without lifting pencil

Continuous?

◆□▶ ◆□▶ ◆□▶ ◆□▶ □ - つへつ

MAT 305: Mathematical Computing

John Perry

- Loops Indefinite loops
- f continuous at x = a if
 - can evaluate limit at x = a by computing f(a), or
 - can draw graph without lifting pencil

Upshot: To find a root of a continuous function f, start with two x values a and b such that f(a) and f(b) have different signs, then bisect the interval.

(need Acrobat Reader to see animation)

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ ▲ □ ● ● ● ●

John Perry

Loops Indefinite loops Summary

Back to the example...

Check hypotheses...

- $f(x) = \cos x x$
 - *x*, cos*x* continuous
 - difference of continuous functions also continuous
 - $\therefore f$ continuous

•
$$a = 0$$
 and $b = 1$

Intermediate Value Theorem applies: can start Method of Bisection.

John Perry

Loops Indefinite loops

How to solve it?

▲□▶▲□▶▲□▶▲□▶ □ のQ@

Idea: Interval endpoints *a* and *b* are not close enough as long as their digits differ through the hundredths place.

John Perry

Loops Indefinite loops

How to solve it?

▲□▶▲□▶▲□▶▲□▶ □ のQ@

Idea: Interval endpoints *a* and *b* are not close enough as long as their digits differ through the hundredths place.

Application: While their digits differ through the hundredths place, halve the interval.

John Perry

Loops Indefinite loops

How to solve it?

◆□▶ ◆□▶ ◆□▶ ◆□▶ □ - つへつ

Idea: Interval endpoints *a* and *b* are not close enough as long as their digits differ through the hundredths place.

Application: While their digits differ through the hundredths place, halve the interval.

"Halve" the interval? Pick the half containing a root!

Summary

< ロ > < 同 > < 三 > < 三 > < 三 > < ○ < ○ </p>

Two types of loops

MAT 305: Mathematical

Computing John Perry

Summary

- definite: *n* repetitions known at outset
 - for $c \in C$
 - collection C of n elements controls loop
 - don't modify *C*
 - indefinite: number of repetitions not known at outset
 - while condition
 - Boolean condition controls loop
