

MAT 305 TEST 1

Directions: Solve these problems. You may write on this paper, but I will not read it. Problems are not weighted equally. Show all necessary work: **computations that are not obvious must be shown.** As for what is “obvious”, better safe than sorry!

True/False. If false, provide a true statement.

1. Computer science is the study of computers. *False: Computer science is the study of what can be computed.*
2. The syntax of a language is its meaning, and semantics is its form. *False: syntax is its form, while semantics is its meaning.*
3. A loop is used to skip over a section of a program. *False: A loop is used to repeat a section of a program.*
4. An algorithm can be written without using a programming language. *True*
5. Programs no longer require modification after they are written and debugged. *False: Programs often undergo modification; for instance, to add new features.*
6. In mathematics, $x = x + 1$ is a true statement. *False: $x = x + 1$ is a false statement.*
7. In Sage and Python, $x = x + 1$ is a valid statement. *True (it's an assignment).*
8. A Python string literal is always enclosed in double quotes. *False: a string literal can be enclosed in single quotes.*
9. In Python, `‘4’+‘5’= ‘9’`. *False: ‘4’+‘5’=‘9’.* (I didn't notice the problem with the quotes on the original.)
10. ASCII is a standard for representing characters using numeric codes. *True.*
11. Sage code and Python code are always interchangeable. *False: Python's input() command won't work in a Sage worksheet, but more importantly, most useful Sage code won't run in Python.*
12. Sage consists of state-of-the-art software written by the world's leading mathematicians for the sake of their own research. *True.*
13. Sage is “free as in beer” because its development was paid for by taxpayers. *True.*
14. All computer algebra systems let you look at their computer code, making them “free as in speech.” *False: Commercial systems like Mathematica, Maple, etc. do not allow you to look at their computer code.*
15. Mathematics is a tool for solving problems. *True.*

Multiple choice.

1. What is the fundamental question of computer science?
 - A. How fast can a computer compute?
 - B. What can be computed?
 - C. What is the most effective programming language?
 - D. How much money can a programmer make?
2. An algorithm is like a
 - A. newspaper
 - B. venus flytrap

- C. drum
D. recipe
3. A problem is **intractable** when
A. you cannot reverse its solution.
B. it involves tractors. (I think the book's author gets a little bored sometimes.)
C. it has many solutions.
D. it is not practical to solve.
4. One difference between a compiler and an interpreter is
A. a compiler is a program.
B. a compiler is used to translate high-level language into machine language.
C. a compiler is no longer needed after the program is translated.
D. a compiler processes source code.
5. The process of describing exactly *what* a computer program will do to solve a problem is called
A. design
B. implementation
C. programming
D. specification
6. Which of the following are *not* allowed in *Python and Sage* expressions?
A. variables
B. statements (*an expression is allowed in a statement, but not vice versa; this is a big difference with C and C++, which allow insanely subtle, hard-to-catch bugs like `if (a=2) { /* do something */ }`*)
C. operators
D. literals
7. Fragments of code that produce or calculate new data values are called
A. identifiers
B. expressions
C. productive clauses
D. assignment statements
8. Accessing a single element, such as a character, from a list or a string is called
A. slicing
B. concatenation
C. assignment
D. indexing
9. If `C` is a collection or a string, which of the following is the same as `C[0:-1]`?
A. `C[-1]`
B. `C[:]`
C. `C[:len(C)-1]`
D. `C[0:len(C)]`
10. Which of the following commercial systems is an example of the type of mathematics Sage specializes in?
A. Maple (*mentioned repeatedly in class as a computer algebra system*)
B. R (*statistics*)
C. Matlab (*numerical analysis and numerical linear algebra*)
D. L^AT_EX (*typesetting mathematics, not computation*)

Discussion

1. What is wrong with the following loop?

```
for c in C:
```

```
    C.append(c+1)
```

The loop is infinite. Despite having the form of a definite loop, it modifies the list which controls it.

2. How would I define a *function* in Sage that held the expression $3x^3 - 1$, and for which I could evaluate at $x = 5$ using the usual notation $f(5)$?

*$f(x) = 3*x^3 - 1$ or $f(x) = 3*x**3 - 1$*

3. How does Sage tell me that a system of linear equations has *no* solution?

It returns an empty list.

4. How does Sage tell me that a system of linear equations has *infinitely many* solutions?

It returns a list of parameterized values, where the parameter is something like r_1 , r_2 , etc.

5. If a system of linear equations has exactly one solution for x , y , and z , how would I extract from Sage the numerical value of x , *after* solving the system by typing `sols = solve([system of equations], [x, y, z])`?

`sols[0][0].rhs()`

*You need the name of the list of solutions, which is `sols`. This is a list of lists, in the form `[[x=...,y=...,z=...]]`. The first `[0]` obtains the first list of solutions `[x=...,y=...,z=...]`. The second `[0]` obtains the first element of that list, which is the **equation** `x=...`. To extract the **numerical** value of x , we need the dot-command `.rhs()`, which abbreviates “right-hand side.”*
