Numerical integration

④ Summary

Maxima, Sympy, GSL

Limits

Differentiation

Explicit differentiation

Implicit differentiation

Integration

Integrals

Numerical integration

Summary

Maxima: symbolic Calculus

- Storied history
- Written in LISP
- Sometimes buggy in non-obvious ways

Sympy: symbolic Calculus

- Far more recent
- Written in Python
- Often slower than Maxima
- Eventual replacement for Maxima?

GSL: numerical Calculus

- GNU Scientific Library

Limits

Numerical integration

④ Summary

The `limit()` command

Limits

Differentiation

Explicit differentiation

Implicit differentiation

Integration

Integrals

Numerical integration

Summary

`limit($f(x)$, $x=a$, direction)` where

- $f(x)$ is a function in x
- $a \in \mathbb{R}$
- *direction* is optional, but if used has form
 - `dir='left'` or
 - `dir='right'`

Examples

Limits

Differentiation

Explicit differentiation

Implicit differentiation

Integration

Integrals

Numerical integration

Summary

```
sage: limit(x**2-1,x=4)
```

15

```
sage: limit(x/abs(x),x=0)
```

und

(Translation: “undefined”)

```
sage: limit(x/abs(x),x=0,dir='right')
```

1

```
sage: limit(x/abs(x),x=0,dir='left')
```

-1

```
sage: limit(sin(1/x),x=0)
```

ind

(Translation: “indeterminate, but bounded”)

Examples with infinite limits

Limits

Differentiation

Explicit differentiation

Implicit differentiation

Integration

Integrals

Numerical integration

Summary

```
sage: limit(e**(-x),x=infinity)
```

0

```
sage: limit((1+1/x)**x,x=infinity)
```

e

(An indeterminate form!)

```
sage: limit((3*x**2-1)/(2*x**2+cos(x)),x=infinity)
```

3/2

```
sage: limit(ln(x)/x,x=infinity)
```

0

(Another indeterminate form!)

```
sage: limit(x/ln(x),x=infinity)
```

+Infinity

④ Summary

The `diff()` command

`diff(f(x), x, n)` where

- $f(x)$ is a function of x
- differentiate f with respect to x
 - “*semi-optional*”: mandatory if f has other variables
 - e.g., partial differentiation, or unknown constants
- (*optional*) compute the n th derivative of $f(x)$

Examples

```
sage: diff(e**x)
```

```
e^x
```

```
sage: diff(x**10, 5)
```

```
30240*x^5
```

```
sage: diff(sin(x), 99)
```

```
-cos(x)
```

```
sage: var('y')
```

```
y
```

```
sage: diff(x**2+y**2-1)
```

```
... output cut ...
```

```
ValueError: No differentiation variable specified.
```

```
sage: diff(x**2+y**2-1, x)
```

```
2*x
```

Limits

Differentiation

Explicit differentiation

Implicit differentiation

Integration

Integrals

Numerical integration

Summary

```
sage: f(x) = sin(x)
```

```
sage: df(x) = diff(f)
```

```
sage: m0 = df(0)
```

```
sage: p0 = point((0,f(0)),pointsize=30)
```

```
sage: fplot = plot(f,xmin=-pi/2,xmax=pi/2,  
                  thickness=2)
```

```
sage: tan_line = plot(m0*(x-0)+f(0),xmin=-pi/2,  
                     xmax=pi/2,rgbcolor=(1,0,0))
```

```
sage: show(p0+fplot+tan_line,aspect_ratio=1)
```

Numerical integration

Summary

The `implicit_diff()` command

Limits

Differentiation

Explicit differentiation

Implicit differentiation

Integration

Integrals

Numerical integration

Summary

There is no `implicit_diff()` command. To differentiate implicitly,

- define `yvar` as a variable using the `var()` command;
- define `yf` as an implicit function of `x` using the `function()` command;
- move everything to one side (as in implicit plots);
- differentiate the non-zero side of the equation; and
- `solve()` for `diff(yf)`

Example

Limits

Differentiation

Explicit differentiation

Implicit differentiation

Integration

Integrals

Numerical integration

Summary

```
sage: y = function('y',x)
```

```
sage: y
```

```
y(x)
```

(... so y is recognized as a function of x)

```
sage: diff(y)
```

```
D[0](y)(x)
```

(Sage's $\frac{dy}{dx}$)

```
sage: expr = x**2 + y**2 - 1
```

```
sage: diff(expr)
```

```
2*y(x)*D[0](y)(x) + 2*x
```

```
sage: deriv = diff(expr)
```

```
sage: solve(deriv,diff(y))
```

```
[D[0](y)(x) == -x/y(x)]
```

... that is, $y'(x) = -\frac{x}{y}$.

Use computer memory, not yours

Limits

Differentiation

Explicit differentiation

Implicit differentiation

Integration

Integrals

Numerical integration

Summary

```
sage: y = function('y',x)
```

```
sage: yprime = diff(y)
```

```
sage: deriv = diff(x**2+y**2-1)
```

```
sage: solve(deriv,yprime)
```

```
[D[0](y)(x) == -x/y(x)]
```

1 picture = 1000 words

Limits

Differentiation

Explicit differentiation

Implicit differentiation

Integration

Integrals

Numerical integration

Summary

```
sage: yvar = var('y')
sage: yf = function('y',x)
sage: yprime = diff(yf)
sage: f = yf**2 - x**3 + x
sage: df = diff(f)
sage: solve(df,yprime)
[D[0](y)(x) == 1/2*(3*x^2 - 1)/y(x)]
sage: mx(x,yvar) = 1/2*(3*x**2 - 1)/yvar
sage: fplot = implicit_plot(yvar**2-x**3+x,
                           (x,-2,2),(yvar,-2,2),color='red')
sage: tan_line = plot(mx(-0.5,sqrt(3/8))
                     *(x+0.5)+sqrt(3/8),
                     xmin=-2,xmax=2)
sage: show(fplot+tan_line,aspect_ratio=1)
```

④ Summary

The `integral()` command

Limits

Differentiation

Explicit differentiation

Implicit differentiation

Integration

Integrals

Numerical integration

Summary

`integral($f(x)$, x , $xmin$, $xmax$)` where

- $f(x)$ is a function of the (optional) variable x
- (optional) $xmin$ and $xmax$ are limits of integration

Example

Limits

Differentiation

Explicit differentiation

Implicit differentiation

Integration

Integrals

Numerical integration

Summary

```
sage: integral(x**2)
1/3*x^3
```

```
sage: integral(x**2,x,0,1)
1/3
```

```
sage: integral(1/x,x,1,infinity)
... output cut...
ValueError: Integral is divergent.
```

```
sage: integral(1/x**2,x,1,infinity)
1
```

Beware the Jabberwock...

```
sage: integral(1/x**3,x,1,infinity)
```

... output cut...

```
ValueError: Integral is divergent.
```

(What the—? a Maxima bug!)

(This error should not occur in Sage after version 4.1.1)

His vorpal sword in hand...

Limits

Differentiation

Implicit differentiation

Integration

Integrals

Numerical integration

Summary

Fortunately, Sympy works great for this integral:

```
sage: integral(1/x**3,1,infinity,  
              algorithm='sympy')
```

1/2

(Correct answer!)

Snicker snack!

Maxima bug confirmed

http://trac.sagemath.org/sage_trac/ticket/6420

- Maxima 5.13.0 was correct
 - in older versions of Sage
- Bug introduced in Maxima 5.16.3
 - Sage 4.0.2–4.1.1
- Bug fixed in Maxima 5.18.1
 - Sage 4.1.2 ← Maxima 5.19

1 picture $\stackrel{?}{=} 1000$ words

```
sage: fplot = plot(sin(x),xmin=0,xmax=pi,  
fill='axis')
```

```
sage: farea = integral(sin(x),x,0,pi)
```

```
sage: areatext = text(farea,(pi/2,0.5),fontsize=40)
```

```
sage: fplot+areatext
```

Numerical integration: Review

Implicit differentiation

Integration

Integrals

Numerical integration

Summary

Not all integrals can be simplified into elementary functions

Numerical integration: Review

Limits

Differentiation

Explicit differentiation

Implicit differentiation

Integration

Integrals

Numerical integration

Summary

Not all integrals can be simplified into elementary functions

Example

$$\operatorname{erf}(x) = \frac{2}{\sqrt{\pi}} \int e^{-x^2} dx$$

(Gaussian error function)

```
sage: integral(e^(-x^2))  
1/2*sqrt(pi)*erf(x)
```

Numerical integration: Review

Limits

Differentiation

Explicit differentiation

Implicit differentiation

Integration

Integrals

Numerical integration

Summary

Not all integrals can be simplified into elementary functions

Example

$$\int_{-1}^1 \sqrt{1 + \frac{4x^2}{1-x^2}} dx$$

(arclength of an ellipse)

```
sage: integral(sqrt(1+4*x**2/(1-x**2)),-1,1)
integrate(sqrt(-4*x^2/(x^2 - 1) + 1), x, -1, 1)
```

The `numerical_integral()` command

Limits

Differentiation

Explicit differentiation

Implicit differentiation

Integration

Integrals

Numerical integration

Summary

`numerical_integral(f(x), xmin, xmax, options)` where

- $f(x)$ is a function of the defined variable x
- $xmin$ and $xmax$ are the limits of integration
- *options* include
 - *max_points*, the maximum number of sample points (default: 87)

Gives two results!!!

- approximation to area
- error bound
- returned as Python tuple

Example

```
sage: numerical_integral(sqrt(1+4*x**2/(1-x**2)),  
                          -1,1)  
(4.8442240644980235, 4.5351915253605327e-06)
```

- error bound is approximately $4.535 \times 10^{-6} \approx .000004535$
- so arclength is approximately $2 \times 4.84422 = 9.68844$

Improving the estimate

```
sage: numerical_integral(sqrt(1+4*x**2/(1-x**2)),  
                          -1,1,max_points=250)  
(4.8442240644980235, 4.5351915253605327e-06)
```

- error bound is approximately $4.535 \times 10^{-6} \approx .000004535$
- so arclength is approximately $2 \times 4.84422 = 9.68844$

Doesn't seem to improve :-)

Worsening the estimate

```
sage: numerical_integral(sqrt(1+4*x**2/(1-x**2)),  
                          -1,1,max_points=10)  
(4.8363135584457568, 0.69875843576683905)
```

- error bound is approximately 0.7...!
- so arclength is somewhere on interval (4.1, 5.5)

Ouch!

Accessing only the integral

- `[i - 1]` extracts the i th element of an ordered collection (list, tuple, etc.)
- first entry of result of `numerical_integral()` is the approximation

```
sage: app_int = numerical_integral(  
                                sqrt(1+4*x**2/(1-x**2)), -1, 1)
```

```
sage: app_int[0]  
4.8442240644980235
```

③ Integration

Integrals

Numerical integration

④ Summary

Summary

- Sage relies on Maxima for symbolic integration and differentiation
 - Usually works fine
 - Eventual replacement: Sympy
 - Can call Sympy now
 - some things don't work
- Implicit differentiation requires some effort
 - define y as a function of x , not as a variable
- Numerical integration through GSL
