Computing John Perry

### Exact solutions

Extracting solutions Linear inequalities Systems of linear equations

Approximate solutions to equations

Summary

- Many equations can be solved without rounding
  - exact solutions
  - Solving by radicals: old, important problem
    - Niels Abel, Evariste Galois, Joseph Lagrange, Paolo Ruffini, ...
  - Special methods
- Others require approximate solutions

# John Perry

### Exact solutions to equations and inequalities

### Exact solutions

Extracting solutions Linear inequalities Systems of linear equations

Approximate solutions to equations

Summary

# The solve() command

◆□▶ ◆□▶ ◆□▶ ◆□▶ □ - つへつ

# solve(eqs, vars) where

- eqs is an equation or a list of equations
- vars is an indeterminate or list of indeterminates to solve for
  - unlisted indetermintes treated as constants
- returns a list of solutions if Sage can solve eqs exactly

# John Perry

# Exact solutions to equations and inequalities

### Exact solutions

- Extracting solutions Linear inequalities Systems of linear equations
- Approximates solutions to equations
- Summary

# = ≠ ==

# FACT OF PYTHON

- = (single)
  - assignment of a value to a symbol
  - f = x \* \* 2 4 assigns the value  $x^2 4$  to f
  - "let  $f = x^2 4$ "
- == (double)
  - two quantities are equal
  - 16==4\*\*2 is true
  - 16==5\*\*2 is false
  - 16==x\*\*2 is *conditional*; it depends on the value of x
- Confuse the two? *naughty user*

◆□ ▶ ◆□ ▶ ◆ □ ▶ ◆ □ ▶ ● □ ● ● ● ●

# John Perry

Exact solutions to equations and inequalities Exact solutions Linear inequalities Systems of linear equations

Approximates solutions to equations

Summary

# r1?!? What is r1?

r1 is a *parameter* that can take infinitely many values
[[x == 13\*r1 - 5, y == 10\*r1 - 4, z == r1]]
corresponds to

$$x = 13t - 5$$
,  $y = 10t - 4$ ,  $z = t$ .

# Example

t = 0?

- x = -5, y = -4, z = 0
- Substitute into system:

$$3(-5)-4(-4)+0 = 1$$
  
2(-5)-3(-4)+4(0) = 2  
-6(-5)+8(-4)-2(0) = -2.

 Linear inequalities
 Systems of linear equations

# 2 Approximate solutions to equations

# **3** Summary

# John Perry

Exact solutions to equations and inequalities Exact solutions Extracting solutions Linear inequalities Systems of linear equations

Approximate solutions to equations

Summary

# • Exact solutions often... complicated

$$-\frac{1}{2} \cdot \sqrt[3]{\frac{\sqrt{3713}}{54} + \frac{7}{6}} \cdot \left(1 + i\sqrt{3}\right) + \frac{-2 + 2i\sqrt{3}}{9} \cdot \sqrt[3]{\frac{\sqrt{3713}}{54} + \frac{7}{6}}$$

Why approximate?

- Approximate solutions easier to look at, manipulate -0.8280018073 0.8505454986*i*
- Approximation often *much*, *much* faster!
  - except when approximation fails
    - bad condition numbers
    - rounding errors
    - inappropriate algorithm (real solver, complex roots)

Approximate solutions to equations

Summary

- distinguish = (assignment) and == (equality)
- Sage can find *exact* or *approximate* roots
- solve() finds exact solutions
  - not all equations can be solved exactly
  - systems of linear equations always exact
  - extract using [ ] and .rhs()
- find\_root() approximates real roots on an interval
  - error if no roots on interval
- .roots(ring=...) approximates roots
  - RR for real roots only; CC for all complex roots
  - append to polynomial or equation
