Analogy: "Free" Mathematics

◆□▶ ◆□▶ ◆□▶ ◆□▶ □ - つへつ

Theorem (Euclid) *There are infinitely many primes.*

Proof.

- Consider finite list of primes, q_1, q_2, \ldots, q_n .
- Let $p = q_1 q_2 \cdots q_n + 1$.
- Fact: since $p \neq 1$, divisible by at least one prime
- p not divisible by any q_i (remainder 1, not 0).
- *p* must be divisible by an unlisted prime
- .: no finite list, lists all primes.

John Perry

- Getting started with Sage
- Using computer memory
- Summary

How to get Sage

- Best: links on the website
- Alternate: SageMathCloud
- Linux users:¹ sudo dnf install sagemath
- People with delusions of grandeur: Download, install to your computer
 - can tinker with/break the source code
 - Windows? need LiveCD or VirtualBox player: www.virtualbox.org/wiki/Downloads
 - ask nicely, & I might give you a DVD with Sage for Windows, Mac, Linux

¹Because Fedora is the One True Linux. People who want to apt-get stuff can go ask Debian or Ubuntu users how to do it.

Computing John Perry

MAT 305: Mathematical

What is Sage? "Computer algebra" Why Sage? Sage and Python

Getting started with Sage

- Using computer memory
- Summary

• Log in to Bagheera (use links on class web page, have I mentioned that yet?)

First steps in Sage

▲□▶▲□▶▲□▶▲□▶ □ のQ@

- Start a new worksheet
 - rename it "First Sage Assignment"
- *If you like* (not always recommended)Click "Typeset"

John Perry

What is Sage? "Computer algebra" Why Sage? Sage and Python

Getting started with Sage

Using computer memory

Summary

Working with variables

▲□▶▲□▶▲□▶▲□▶ □ のQ@

Variable: symbol that represents another value Example

sage: a = 7

Until you change it, a represents 7

John Perry

What is Sage? "Computer algebra" Why Sage? Sage and Python

Getting started with Sage

Using computer memory

Summary

Symbols of symbolic computation

Indeterminate: symbol with no specific value ("unknown")special kind of variable

- x pre-defined
 - if value assigned, no longer indeterminate
- Need more? use var()
 - var('y') defines y
 - var('a b c d') defines *a*, *b*, *c*, *d*
- Use undefined variable?

```
sage: x+y+z
...
NameError: name 'z' is not defined
```

Arithmetic

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ ▲ □ ● ● ● ●

operation	sage equivalent
add x, y	x + y
subtract <i>y</i> from <i>x</i>	x - y
multiply x, y	x * y
divide <i>x</i> by <i>y</i>	x / y
raise <i>x</i> to the <i>y</i> th power	x ** y or x ^ y

What is Sage? "Computer algebra" Why Sage?

MAT 305: Mathematical

What is Sage?	
"Computer algebra"	
Why Sage?	
Sage and Python	

MAT 305: Mathematical

Computing John Perry

Getting started with Sage

Using computer memory

operation	sage equivalent
add x, y	x + y
subtract <i>y</i> from <i>x</i>	x - y
multiply x, y	x * y
divide <i>x</i> by <i>y</i>	x / y
raise <i>x</i> to the <i>y</i> th power	x ** y or x ^ y

- Do not omit muliplication symbol
 - $2*x \longrightarrow 2x$
 - $2x \longrightarrow SyntaxError$: invalid syntax
 - possible, but dangerous, to get around this using implicit_multiplication(True)
- Do not neglect parentheses
 - $e^{**(2*x)} \neq e^{**2*x}$
- Prefer ** to ^ for various sordid reasons (scripting)

Example

▲ロ▶ ▲周▶ ▲ヨ▶ ▲ヨ▶ ヨ のの()

MAT 305: Mathematical

Computing John Perry

Getting started with Sage

Using computer memory

Summary

• Some expressions simplify automatically; many need hints

```
sage: (x**2 - 1) / (x - 1)
(x^2 - 1)/(x - 1)
sage: (factor(x**2 - 1)) / (x - 1)
x + 1
```

(good reason this isn't automatic: what?)

• Expand
$$(x-1)(x^3+x^2+x+1)$$

sage: expand((x-1)*(x**3+x**2+x+1))
x^4 - 1

• Round e to 5 decimal places

```
sage: round(e,5)
2.71828
```

"Computer algebr Why Sage? Sage and Python

Getting started with Sage

Using computer memory

Summary

Names for expressions ("identifiers") can

- contain letters (A–Z), digits (0–9), or the underscore (_) but
- must begin with a letter or the underscore and
- may not contain other character (space, tab, !@#\$%^{*}, etc.)

John Perry

What is Sage? "Computer algebra" Why Sage? Sage and Python

Getting started with Sage

Using computer memory

Summary

• Manipulate just like the object it represents

Using expressions

▲□▶▲□▶▲□▶▲□▶ □ のQ@

```
sage: factor(f)
(x - 1)*(x + 1)
sage: f - 3
x^2 - 4
```

• Avoid repeating computations: substitute!

```
sage: f(x=3)
8
sage: f(x=-1)
0
sage: f(x=4)
15
```

John Perry

What is Sage? "Computer algebra" Why Sage? Sage and Python

Getting started with Sage

Using computer memory

Summary

Alternate method of substitution

Sometimes you should use the **dictionary** method of substitution. An example would be when an identifier stands for a variable.

```
sage: f = x**2 + y**2
sage: f(x=3)
9 + y^2
sage: f({x:3})
9 + y^2
```

This also means replace x by 3 in f
